Benefits of Power Factor Improvement

Power Cost Reduction

The ratio of working current to total current is called "Power Factor." The function of power factor correction capacitors is to increase the power factor by compensating for inductive electrical equipment loads. Utility companies in many areas include a penalty charge in the electrical rate for low power factor. The installation of power factor capacitors on the user's electrical distribution system eliminates the necessity of paying premium rates to the utility company for poor power factor. The savings the utility company derives in reduced generation, transmission and distribution costs are passed on to the user in the form of lower electrical charges. Three of the more common ways a utility charges a user for poor power factor are based on:

- KW demand with a trigger point typically between 85% and 95% power factor.
- KVA demand
- KVAR demand

When the utility uses either KVA demand or KVAR demand as the basis for its penalty structure, all users pay a penalty, but those with high power factor pay a much lower penalty.

System Capacity Increase

By adding capacitors to the system, the power factor is improved and the KW capacity of the system is increased. For example, a 1,000 KVA transformer with a 70% power factor provides 700 KW of power to the main bus. With the installation of capacitors so that the power factor is improved, say, to 90%, the KW capacity of the system is increased to 900 KW.

Voltage Improvement and Power Loss Reduction

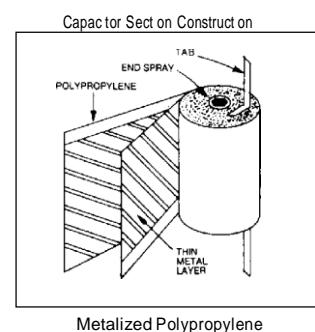

System losses are also reduced through power factor correction by reducing the total current and power in the system. A 20% reduction in current will yield a 36% reduction in distribution system losses. In this situation, an energy savings of as much as 50% will be realized with the installation of power factor capacitors.

In addition, power factor capacitors decrease the distribution system voltage drops and fluctuations.

Characteristics

Construction

The metalized dielectric system employed in the fixed and other automatic systems is constructed of two sheets of polypropylene film, each with a thin layer of vacuum deposited metal, on one side of the dielectric, that serves as the capacitor electrode. Because the electrode is just a few hundred angstroms thick, it has a very limited current carrying capability at any given point. Each end of the capacitor section is bonded with an end spray that has a relatively high current carrying capacity. The end spray serves as a connection between the section and the electrical tabs that are connected to the external connectors. This construction minimizes the current at any point in the section and helps extend capacitor life.

Type GMP Low Voltage Power Factor Correction Capacitors

GMP Series Multi-Unit Indoor/Outdoor Assemblies

Available Ratings: Not for harmonic applications

- 240 volt, 42.5-200 kVAr, single and 3-phase, 60 Hz To determine kVAr at 208 volts, multiply 240 volt KVAr by .75
- 480 volt, 110-500 kVAr, single and 3-phase, 60Hz
- 600 volt, 65-300 kVAr, 3-phase, 60Hz
- UL Listed
- Discharge resistors reduce voltage to 50 volts or less within one minute
- Painted stainless steel enclosure NEMA 3 & 12
- Factory installed fuses and blown fuse indicating lights (Optional)
- Pressure Sensitive Interrupter (PSI) in each cell

GMP assemblies feature multiple capacitor cells with metalized polypropylene film dielectric which provides instantaneous self-healing action and reduced energy losses. Safety is provided with the patented GE internal Pressure Sensitive Interrupter (PSI) designed to sense the buildup of pressure if a fault occurs and to interrupt the internal electrical connections before the capacitor cell can rupture. GMP cells feature time proven dielektrol, a biodegradable NFPA Class B dielectric fluid. GMP cells offer high reliability and long life and are suitable for operation over a temperature range of -40°C to 46°C.

Line Fuse/Blown Fuse Indicating Lights

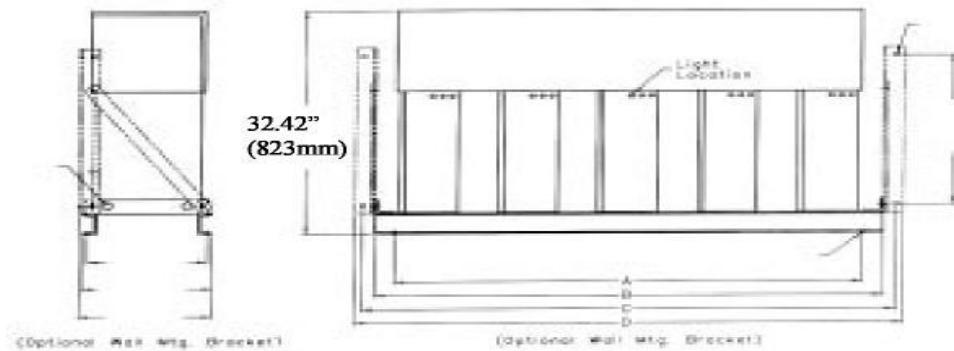

When fuses are specified, Ultravar provides 200,000 amp interrupting capacity fuses. Blown fuse indicating lights are also an option. Order by appropriate BASIC CATALOG number plus the appropriate accessory SUFFIX

Mounting

GMP series equipments are designed to be mounted upright on any level surface.

An adapter kit is required for wall mounting. Order the wall mounting kit by Catalog No.I86C323600005.

Line Connection and Cable Entrance: Entrance may be made through either end panel (after first punching out the appropriate size hole). Lug terminals are provided on each phase.

Low Losses

All capacitors consume a certain amount of electrical energy. Capacitors with metallized polypropylene will consume less energy than capacitors utilizing other dielectric systems. The loss of energy is manifested in the form of heat. Reduced heat dissipation results in lower operating temperatures, which in turn contributes to extended capacitor life. Ultravar capacitors have watt loss as low as 0.25 watt/kVAr to 0.2 watt/kVAr.

Self Healing

All Ultravar low voltage power factor correction capacitors are self healing (or self clearing), which is a property of the capacitor to restore the dielectric to an acceptable condition should a breakdown occur during operation. The thin metal layer around the fault point will act like a fuse with a very low current rating. Under a fault condition, the current will vaporize the metal around the fault point and clear (heal) the fault. The self healing activity further restricts the maximum current that can pass through the fault. Typically, the current spikes due to a fault in a metallized design capacitor are less than 200 amps and a few microseconds, regardless of the available fault current.

Dielectric Fluid

All Ultravar power factor correction capacitors are filled with a biodegradable dielectric fluid. It is a non-toxic and non-irritating fluid requiring no special handling and is not regulated by the Department of Transportation.

Listed below are some of the advantages that the Ultravar dielectric fluid offers over competitive products employing metallized designs and dielectric fluids.

- Low film swelling
- High thermal stability
- High resistance to oxidation
- High resistance to gas evolution under electrical stress
- Non-flammable

Pressure Activated Circuit Interrupters

Incorporated into each capacitor is a pressure sensitive circuit interrupter. This UL and CSA listed device safely removes the capacitor from service at end-of-life or under heavy fault conditions, maintaining case integrity. Due to the design and acceptance of the pressure interrupter, Ultravar capacitors are listed for use with or without line fuses at 10,000 AFC rating.

External Fusing

In addition to the pressure sensitive interrupter, three current-limiting fuses are available for the Ultravar delta-connected capacitors. Interrupting ampacity for static (fixed) assemblies is as follows:

• A.M.P., MVA	100 kaic
• ICS, HSICS	200 kaic

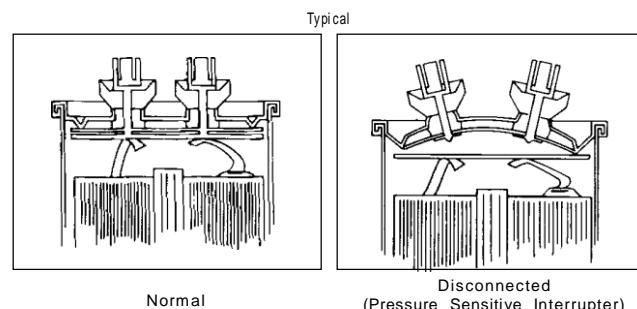

All low voltage fuses are 600 volt rated.

True Loss-of-KVAR

Blown fuse lights are a time and labor saving device when performing routine maintenance on fixed-bank capacitors. Ultravar type A.M.P. and MVA capacitors are equipped with a true loss-of-KVAR feature. Self clearing capacitors fail open, seldom causing related fuse operation. It is possible to have a failed cell and a good fuse and not know of the failure until it's too late. The Ultravar true loss-of-KVAR feature connects the capacitor as part of the "blown fuse light" circuit. If either the fuse or capacitor pressure interrupter operates, the indicating light will illuminate, reducing the risk of penalty charges. Ultravar ICS capacitor banks are also available with this optional feature.

Quality

All Ultravar power factor correction capacitors are 100% tested prior to shipment. They meet or exceed applicable industry standards, offering the highest product quality available.

A.M.P.

Low Voltage Assemblies

Features

Capacitor Unit

Each UL and GSA listed capacitor used in the A.M.P. and MVA assemblies is built as an internally connected three phase unit (not as single phase cells, externally connected). Each capacitor is hermetically sealed in a steel case and incorporates a pressure- activated interrupter that minimizes the possibility of case rupture and removes all three phases from the line so as not to contribute to phase voltage unbalance.

Case

The A.M.P. and MVA assemblies have an 18 gauge steel enclosure. Keyhole mounting eyes allow for quick and easy installation for either floor or wall mounting. The assembly is completely gasketed, providing for indoor or outdoor use, and is finished in a UL recognized indoor/outdoor paint system that provides superior corrosion resistance. As a special option, the enclosure is also available in stainless steel.

Indicating Lights (Optional)

Glowing neon lights indicate loss-of-KVAR due to activation of either the capacitor pressure interrupter or a blown fuse. This option is highly recommended to aid in maintenance and to prevent any penalty charges due to activated safety features.

Fuses

Each three (3) phase capacitor cell is protected with three current limiting replaceable fuses rated at 100,000 amps interrupting capacity.

Environmental Parameters

Operating temperatures between -40° C and +46° C (-40° F to +115° F) are permissible. Operation at temperatures above +46° C will shorten capacitor life.

Ground Terminal

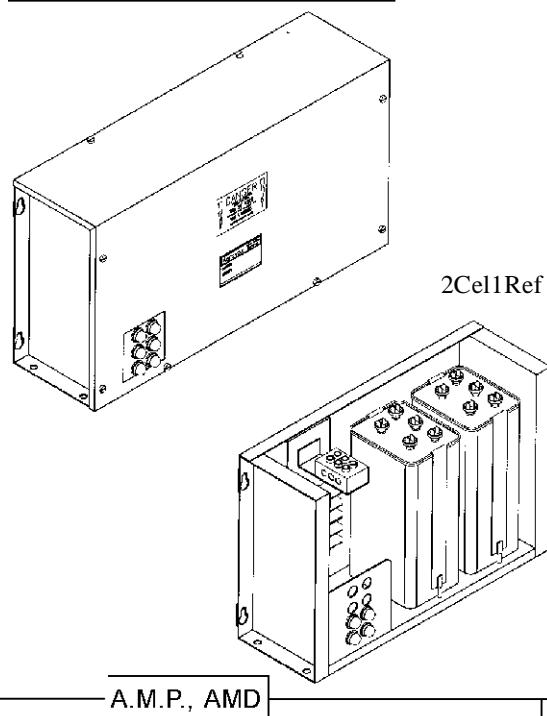

To facilitate proper grounding of the unit, a ground terminal is provided.

Discharge Resistors

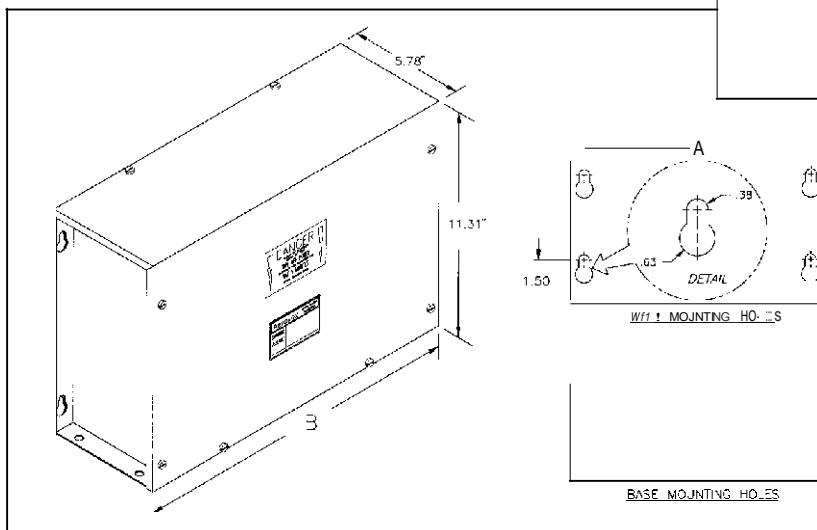

Each capacitor cell employs a resistor network to reduce residual voltage to 50 volts or less within one minute after removal from an energized circuit.

Terminal Block

Each internal capacitor is pre-wired to a heavy duty terminal block for easy accessibility and installation.

Outline Dimensions (inches)

Size	A	B
	inches	inches
1 cell	11.69	12.68
2 cell	15.69	16.68
3 cell	19.69	20.68
4 cell	24.69	25.68

A.M.P.

Design

A.M.P. units incorporate the most advanced design technology available for metalized polypropylene capacitors. Losses due to heat are as low as 0.25 watts per KVAR. Volumetric efficiency is also improved allowing for smaller sized capacitors which reduces shipping weight. Extensive field use has proven A.M.P. capacitors will withstand today's electrical environment with a (continuous duty) life expectancy of twenty years.

Features

Capacitor Life

Incorporating a well proven compact enclosure with the latest design parameters of metalized polypropylene capacitors ensures a long service life. This is an industrial design, rated for the 20 year continuous duty life criteria customers expect from Ultravar.

OFG

Available Ratings: Not for harmonic applications

240 volt, 1-15 kVAr, 3-phase, 60 Hz

480 volt, 1-30 kVAr, 3-phase, 60 Hz

- > 4-ft., 4-conductor flexible cable
- > Watertight connector
- > UL Recognized Pressure Sensitive Interrupter (PSI) in each cell
- > Discharge resistors reduce voltage to 50 volts or less within 1 minute
- > Enclosure NEMA 3

OFG assemblies feature multiple capacitor cells with metallized polypropylene film dielectric which provides instantaneous self-healing action and reduced energy losses. Safety is provided with the patented internal Pressure Sensitive Interrupter (PSI) designed to sense the buildup of pressure if a fault occurs and to interrupt the internal electrical connections before the capacitor cell can rupture. OFG cells feature time-proven Dielektrol, a biodegradable NFPA Class IIIB dielectric fluid. OFG offers high reliability and long life and is suitable for operation over a temperature range of -40 C to 46 C.

Mounting

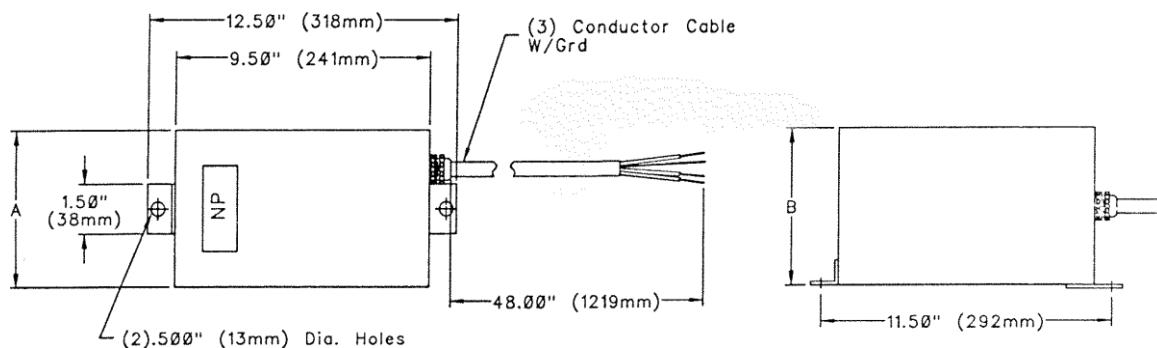

OFG series units are designed for outdoor pole or wall mounting. Their application, however, may be extended to other motor applications installed indoor or outdoor.

Line Connection and Cable Entrance

A 4 ft. 4-conductor flexible cable with watertight connector is provided for easy installation.

ICS

**180 KVAR maximum at 240 volts
600 KVAR maximum at 480 and 600 volts**

Design

ICS heavy duty power factor correction assemblies are industrial rated, metalized electrode, rack mounted (industry standard 13.5" wide) premium grade capacitors. As an option they are available with a true-loss-of-KVAR feature; consult the factory for details concerning this feature.

Features

Capacitor Life

Each ICS assembly provides sufficient air space between the MMP style capacitor(s) to allow convection cooling of the cells. This reduces heat transfer and enhances capacitor life. MMP capacitors have a field proven 20 year continuous duty life expectancy.

Capacitor Unit

The ICS single cell enclosure is 18 gauge jig-welded steel. Each assembly is painted with a UL listed ANSI #70 light gray corrosion-resistant paint for indoor or outdoor placement. Each capacitor cell is hermetically sealed. Each capacitor multi-cell assembly is supported by a jig welded, heavy steel angle frame with a grounding lug attached. It is suitable for indoor and outdoor use, either floor, ceiling or wall mounted.

Indicating Lights (Optional)

Blown fuse or "Loss-of-KVAR" neon indicating lights are an available option. A glowing light indicates blown fuse or loss-of-KVAR.

Fuses

Each capacitor assembly has three indicating type 600 volt fuses with an interrupting capacity of 200,000 amps. UL and CSA listed assemblies are also available with no fuses.

Environmental Parameters

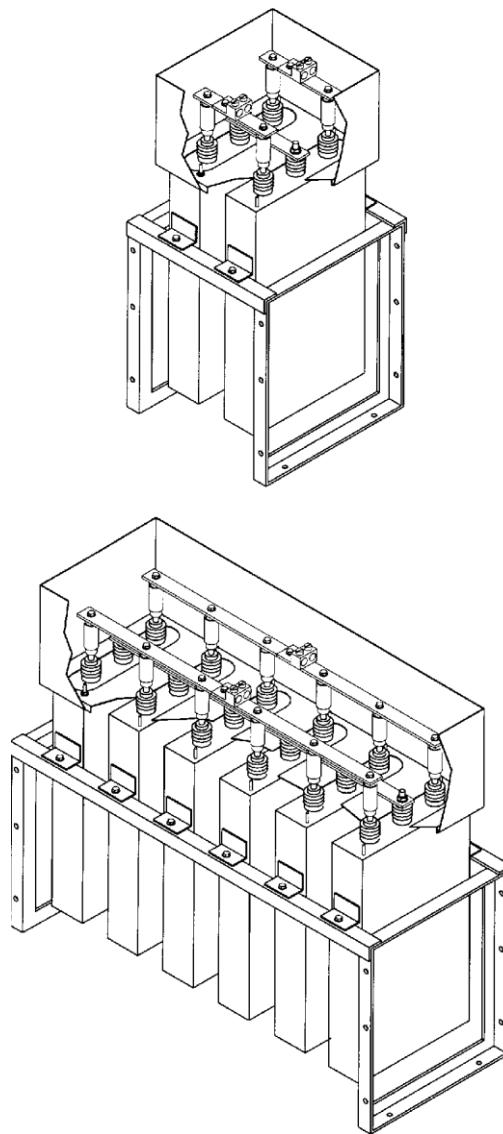

Operating temperatures between -40 °C and 46 °C (-40 °F to 115 °F) are permissible. Operation at temperatures above 46 °C will shorten capacitor life.

Bus Bar

Solid aluminum bus bars with electroplated aluminum connectors are provided for both internal and external interconnections. Phase connections on individual units incorporate an integral solder less connector on each fuse or terminal. Multiple units include properly sized electro-plated aluminum connectors securely bolted to the bus bar.

Discharge Resistors

Each capacitor cell incorporates discharge resistors designed to reduce capacitor voltage to 50 volts or less within one minute after removal from an energized circuit, per NEC, NEMA, IEEE, UL, and CSA.

* No optional floor bracket required.
 Capacitor bracket extends 0.38" below case.

** No optional floor bracket required.
 Capacitor bracket extends 1.38" below case.

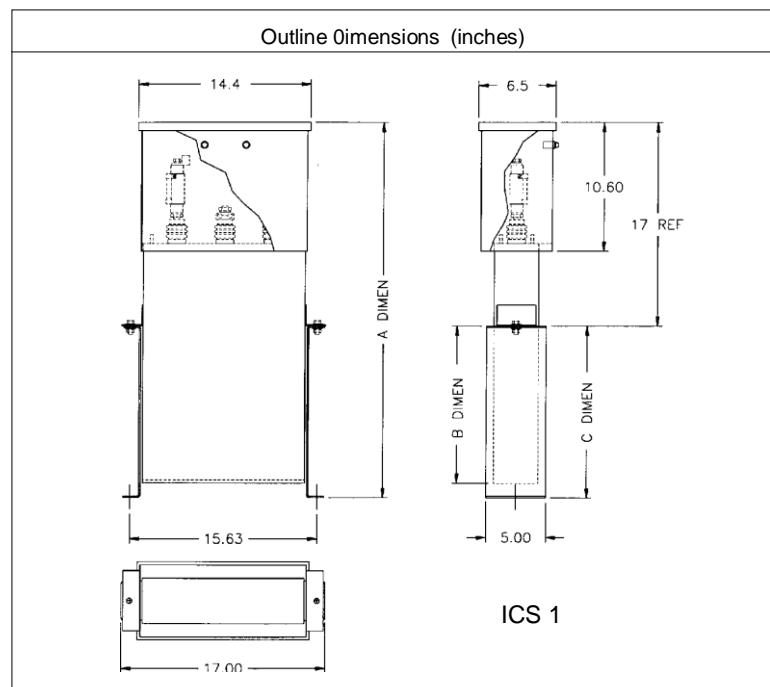

Note: Consult factory for single phase units

Notes: (1) For Blown Fuse indicating lights option add suffix L to the catalog number i.e.

ICS1100F333FL

(2) For no fuses replace suffix 3F with NF
 i.e. **ICS1100F333NF**

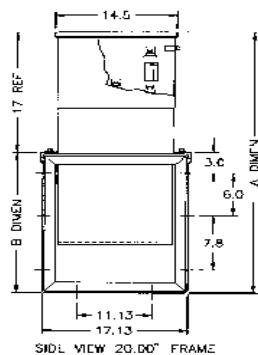

(3) For 208 volt application use 240 volt capacitors. Multiply the 240 volt KVAR rating by 0.75 to obtain the 208 volt rating.

HSICS

Fixed Power Factor Correction Capacitor System
Tuned for Harmonic Suppression

Application

The proliferation of electronic equipment used to improve efficiencies and provide more reliable performance causes harmonics on power systems. Equipment such as variable speed AC and DC drives, uninterruptible power supplies, switch mode power supplies and other solid state controls or devices inject non linear components into what was a linear system. The application of power factor correction capacitor systems can create unwanted increases in harmonic voltage and current unless the capacitors are properly applied with reactors, in series with the capacitor, to suppress harmful harmonics.

Ultravar's line of fixed, harmonically suppressed capacitors permits the installation of power factor correction capacitors on systems with non-linear components. The HSICS system can be tuned to any desired frequency but is normally tuned for the fifth harmonic.

Ref. View

50 KVAR maximum at 240 volts
200 KVAR maximum at 480 and 600 volts

Design

The installation of this system is application specific. Contact your local, trained representative or Ultravar's Application Engineering Department to ensure the proper combination of capacitors and reactors are used. Misapplication may result without proper guidance.

Typical assemblies are presented below. Consult factory for other application specific assemblies.

Outline Dimensions (inches)

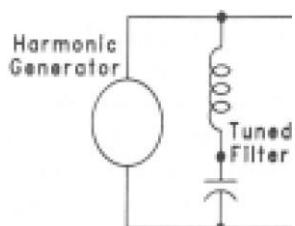

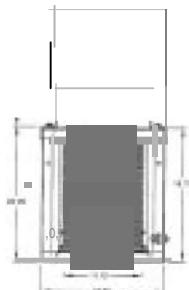

Figure 1

ICC

Application

This capacitor assembly design, rated at 2400V, 4160V or 4800V, is intended for use in plants where the operation of heavy inductive loads and correction on the high voltage side of the system is the preferred method of power factor correction. It should be remembered that capacitors relieve electrical loads from their point of installation back toward the power source.

Design

The ICC assembly employs an all-film dielectric system which contributes to a small physical size and reduced watt loss. The electrodes are aluminum foil construction. All capacitor units are hermetically sealed in a stainless steel case suitable for outdoor use. Molded phenolic bushings are utilized to provide maximum protection against flash over and breakage hazards. The bushing terminals are 0.500-13 thread, plated copper. 75 and 95 kVBiL bushings are also available for outdoor, exposed applications. The three phase units are internally delta connected and only require two current limiting fuses for protection. A third fuse can also be added as an option. Ultravar recommends the use of three fuses for the most complete protection against terminal-to-terminal and terminal-to-ground failures on grounded systems. Two fuses are sufficient to provide protection against terminal-to-terminal failures on ungrounded systems. Each fuse incorporates a blown fuse indicator and has an interrupting capacity of 50,000 symmetrical amps. Ultravar also offers blown fuse lights on these capacitors as an option; consult factory for specific information. ICC capacitors are designed to operate in an ambient temperature range from -40 C to 45 C. All capacitors perform best in a location that allows convection cooling. Excess heat can reduce operational life of the capacitor.

**25- 00 KVAR maximum at 2400 4160 and 4800 volts
3 Phase 60 Hz**

Features

Bus Bar

1¹/₄" x 1¹/₂" aluminum bus provides connections between capacitors. Copper bus is available as an option; consult factory.

Phase Connectors

Plated solder less connectors provide customer service connections.

Indicating Fuses

Each capacitor assembly has two 50,000 symmetrical amps-interrupting, current-limiting fuses. The fuses incorporate a spring-loaded indicating pin which projects from the top portion of the fuses after fuse operation.

Blown Fuse Lights

This unique Ultravar innovation provides a positive indication of an operating fuse. A glowing neon light makes inspection of capacitors easy, effective and safe. 120 VAC must be supplied from an external source.

Hermetically Sealed Terminal Bushings

The bushings are molded phenolic utilizing a gasketed seal to provide maximum protection against flashover and fluid leakage.

Capacitor

All capacitor seams are heli-arc welded and pressure tested to assure a strong and consistent seal. All capacitors contain less than 3 gallons of dielectric fluid. The epoxylurethane ANSI #70 gray finish is suitable for indoor and outdoor installations.

Terminal Enclosure

Constructed of .062 thick steel, the cover is tightly secured with bolts to the enclosure and sealed with rubber gaskets thus assuring a dustproof and weatherproof seal.

Frame

Multiple capacitor assemblies are supported by a structured aluminum support rack suitable for floor mounting.

Ground Connector

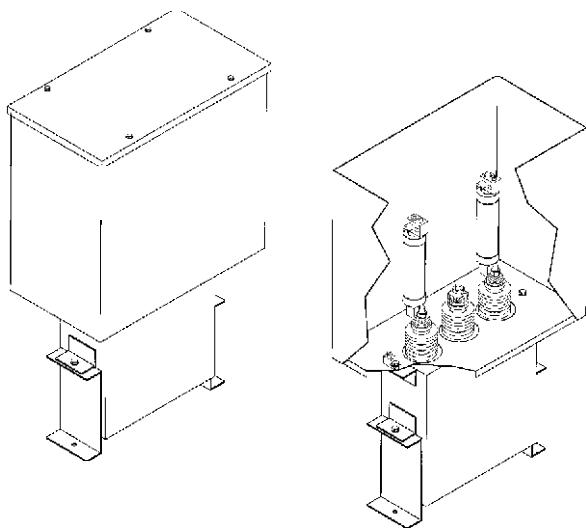

A convenient ground connector is provided as a standard feature.

ICC

Single Unit Assembly

A single unit consists of:

1. Individual capacitor, with each containing less than three (3) gallons of oil.
2. Internal discharge resistors which reduce residual voltage to 50 volts within five minutes after removal from service.
3. Enclosure for indoor dustproof / outdoor weather proof applications.
4. Individual current fuses. (Indicating type with 50,000 ampere interrupting capacity.)
5. Solder-less connectors for phase connections.
6. Floor mounting brackets.
7. Blown fuse lights optional.
8. Consult factory for single phase units.

Special Service Capacitors

300 KVAR maximum at 1040 and 1200 volts

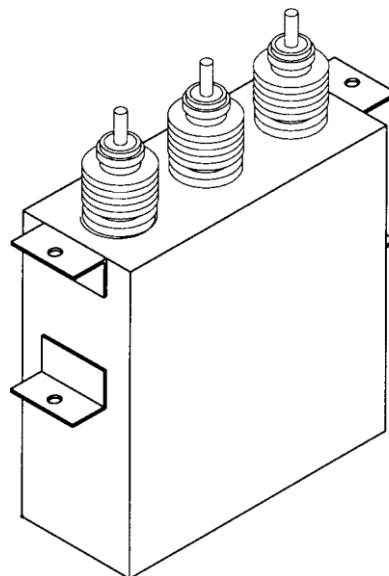

Application

This style capacitor cell is designed for specific applications, primarily in the mining industry.

Design

The design is based on the well proven polypropylene dielectric design. The robust nature of the design allows use under stress, without sacrifice of longevity. The design is based on a twenty-year life expectancy.

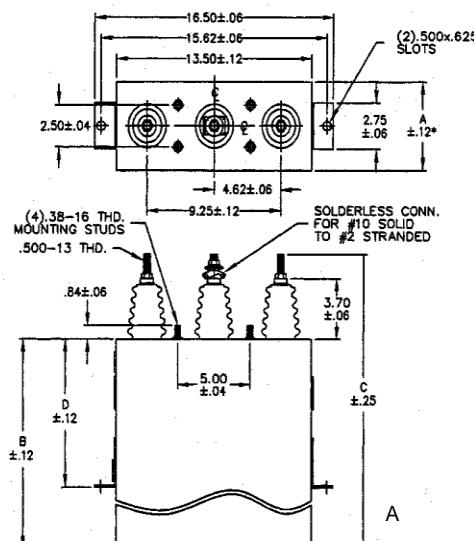

The following is a list of "standard" part numbers; these are for bare cells only. Contact the factory for details and prices, and if it is necessary to employ a cover and fuses, or for other kVAR values.

Options

- 1/4" stud terminals (consult factory)
- Custom designs

Construction:

- Manufactured with the latest technology in low-loss metalized polypropylene film dielectric with a typical watts loss less than .2 watts per kVAr
- Self-clearing technology
- Non-PCB, environmentally-safe biodegradable dielectric fluid.
- Three-phase internal Delta connected
- UL-recognized, pressure-activated interrupter rated 10,000 AFC
- Integral discharge resistors to reduce voltage to 50V or less in 1 min.
- Loss of kVAr standard (indicates when the internal pressure interrupter has operated at end of life, when combined with blown fuse lights)
- Temperature: -40°C to +46°C (-40°F to +115°F)
- Terminals: 1/4" male quick connect lugs
- Torque limit for 1/4" x 20 stud is 20 inch-pounds

NOTE: Table part number for fixed as shown.

Options:

- Single and two-phase designs.
- Different terminal configurations for single and two-phase
- Loss of kVAR terminals

Construction:

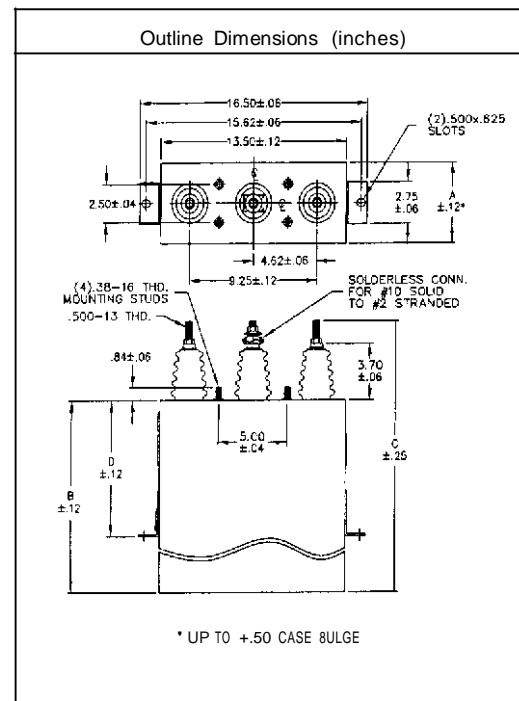

- Manufactured with the latest technology in low-loss metallized polypropylene film dielectric with a typical value of .2 watts per kVAR
- Self-clearing technology
- Non-PCB, environmentally-safe, biodegradable dielectric fluid
- Heavy-gauge, cold-rolled steel welded case for the industrial environment
- UL-recognized ANSI #70 enamel overcoat with zinc rich primer
- Integral discharge resistors to reduce voltage to 50V or less in 1 minute.
- Temperature: -40°C to +46°C (-40°F to +115°F)
- Terminals: Heavy duty 1/2-13 solid brass threaded studs for power connections, plated for corrosion resistance
- 30KV BIL (2.18" creep) fluted ceramic bushing, resilient mounted
- Torque: 1/4-20 studs to 20 inch-pounds and 1/2-13 studs to 160 inch-pounds maximum

* NOTE: Omit center terminal for 1 Phase capacitors

Applicable standards:

NEMA standards publication CP 1-1988 (Shunt Capacitor) or latest revision.

IEEE Standard for Shunt Power Capacitors, Std 18-1992, or latest revision.

IEC Publication 871-1 (1987) or latest revision.

Capacitor Construction

- Capacitor case material is type ANSI 409 stainless steel suitable for outdoor service.
- Capacitor bushings utilize a gasket sealing assembly to provide a mechanical and electrical seal to the capacitor cover. The bushing terminals are 0.500-13 thread tin plated copper.
- The capacitor case is ANSI #70 grey. The paint system is a durable Epoxy/Urethane composition which meets the requirements of ANSI C57.12.31 (Pole Mounted Transformer Enclosure Coating Integrity). A portion of the bottom of the mounting bracket will be left unpainted to allow proper grounding of unit to the capacitor bank.

Internal Construction

- Capacitor units are of the "all film" design using multiple sheets of Hazy™ Polypropylene Film as the solid dielectric material.
- Each capacitor is provided with an internal discharge resistor assembly to reduce the residual voltage to 50 volts or less within 5 minutes after the capacitor is disconnected from rated voltage.
- The insulating liquid is a Non-PCB Synthetic Aromatic Hydrocarbon suitable for use in outdoor shunt capacitors and complies with all the current environmental standards.

Application Notes - Low Voltage

Applies to three-phase, 60 HZ motors when switched with capacitors as a single unit.

Application Notes - Low Voltage

Percent AR is the percent reduction in full-load line current due to capacitors. A capacitor located on the motor side of the overload relay reduces current through the relay. Therefore, a smaller relay may be necessary. The motor-overload relay should be selected on the basis of the motor full-load nameplate current reduced by the percent reduction in line current (percent AR) due to capacitors.

The capacitor size specified on page 18 for T-Frame NEMA Class B Motors will increase the full load power factor to 95% and larger sizes should not be used without consulting Ultravar.

To calculate required kVAR for energy efficient motors (or any motor) use the following formula:

$$\text{KVAR} = \frac{\text{H.P.} \times .746}{\% \text{ efficiency}} \times \sqrt{\frac{I - PF_0^2}{PF_0^2}} - \sqrt{\frac{I - PF_1^2}{PF_1^2}}$$

PF_0 Original Power Factor (supplied by manufacturer)

PF_1 Target Power Factor

H.P. Motor Horsepower from nameplate

% efficiency Motor manufacturer nameplate

Points to Consider when Sizing Capacitors

Two limiting factors must be considered when capacitors are to be switched with a motor as a unit. The first is overvoltage due to self-excitation, and the second is transient torques.

Self excitation voltage: When a motor is disconnected from the line, it will normally rotate for a short time before coming to rest. A capacitor connected to this motor will still be supplying magnetizing current, which will excite the motor. Under these conditions, the motor and capacitor act like a generator and produce a certain voltage because of this "self-excitation." The magnitude of the voltage that can be produced is determined by two things—the rating of the capacitor being used and the speed of the motor involved. It is not uncommon for this "self excitation" voltage to reach 150% of rated voltage if too large a capacitor is being used.

Transient torques: Perhaps even more important than overvoltage is the transient torques that can occur if the motor happens to close back into the line before coming to a complete rest. If the motor is still rotating and acting as a generator, the resulting transient torque may be as much as 20 times the full load torque. Because of transient torque and overload

considerations, most motor manufacturers provide recommendations concerning the maximum capacitor KVAR that should be switched with a given motor. These recommendations are conservative enough to avoid endangering the motor, and will ordinarily result in a corrected power factor of approximately 95-98% at full load.

To avoid nuisance blowing of fuses when capacitors are connected directly across the motor terminals:

1. Motors should not be subject to plugging or reversing duty.

2. Motors should not be operated such that rapid restarting occurs.

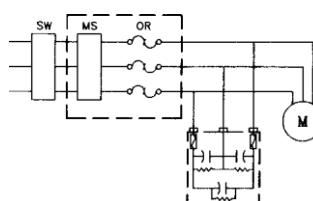

Fig. 1: For new motor installation

Capacitors are connected on motor side of thermal-overloaded relay. Relay should be selected with rating less than motor nameplate full-load current, commensurate with reduced line current effected by the capacitors. This reduction in line current, if not available from tables, may be determined by measuring line current with and without capacitors, or by calculation.

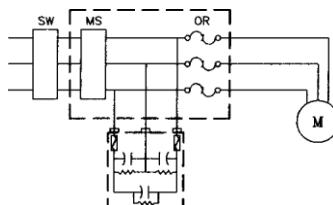

Figure 2: For existing motor installation

Capacitors are connected to line side of thermal-overload relay. In this case the overload relay does not have to be resized.

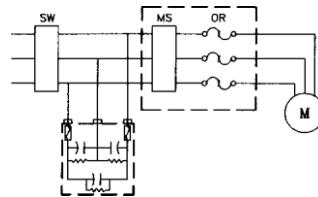

Figure 3:

Capacitors are permanently connected to line, but with protection of a fusible safety switch or circuit breaker which eliminates separate capacitor switch. To avoid nuisance blowing of the capacitor fuses, install the capacitors at this location when the motors are multiple speed, reversing, jogging, inching, or reduced voltage start.

Legend:

SW = fusible safety switch or breaker

MS = motor starter

OR = motor thermal-overload relay

M = motor

Application Notes

Suggested Wire Sizes for Capacitor Installations

The cable sizes indicated in this table are based on 135% of rated current in accordance with NEC 460.

- No more than three single conductors are allowed in a raceway with 30°C ambient. For higher ambient temperatures, consult the National Electrical Code Table 310-16 (correction factor for ambient over 30°C). Rated current is based on operation at rated voltage, frequency, and KVAR.

INSTRUCTIONS FOR INSTALLATION & OPERATION OF FIXED INDUSTRIAL POWER FACTOR CORRECTION CAPACITOR EQUIPMENT

These summarized instructions are included to assist in the installation and operation of Ultravar Industrial Power Factor Correction Capacitors. They provide only the manufacturer's recommended procedures. Since local electrical codes and insurance underwriters requirements vary in many respects, it is impossible to adequately provide for every installation within this instruction. A complete set of instructions is sent with every shipment.

It is therefore imperative that such individual requirements be checked and complied with, rather than rely solely on this guideline as a means of satisfying such regulations.

DESCRIPTION

Type AM assemblies consist of individual capacitors with three external discharge resistors, an internal pressure-activated circuit interrupter, external current limiting fuses, and a heavy duty terminal block, provided for customer phase connections. Units are suitable for both indoor and outdoor use and may be floor or wall mounted.

Type C single unit assemblies consist of the individual capacitor, current limiting fuses, an internal pressure-activated circuit interrupter (600 volt and below), internal discharge resistors and a terminal enclosure with gasketed cover. The units may be floor, wall, or ceiling mounted through the use of mounting brackets ordered with the equipment. Units are suitable for both indoor and outdoor use.

Type C multiple unit assemblies consist of the individual capacitors, current limiting fuses, aluminum bus bars (to parallel the units), solderless connectors for cable connections, a terminal enclosure with gasketed cover and mounting frame. The assembly may be floor, wall, or ceiling mounted without the need for accessory brackets. Units are suitable for both indoor and outdoor use. Assemblies of the same unit capacity may be stacked to a maximum of three high.

Type OFC assemblies consist of individual capacitors with three external discharge resistors, an internal pressure-activated circuit interrupter, an optional 4 foot cable (sized for KVAR requirements) or a heavy duty terminal block is provided for customer phase connections. Units are suitable for both indoor and outdoor use and may be pole or wall mounted.

RECEIVING

All equipment is checked by quality control and is shipped in good condition. Due to possible damage incurred in transit, all equipment should be carefully checked for damaged bushings, leaks, or large dents. If damage is severe, the carrier should be notified immediately and an inspection report requested. A formal claim should then be filed and the nearest Ultravar Sales Office notified for replacement assistance.

SAFETY INSTRUCTIONS

All power must be switched off and must be allowed to discharge before performing any work on capacitor equipment. Capacitors rated 600 volts and below include discharge resistors which reduce the voltage to 50 volts or less within one minute after power is removed. For ratings above 600 volts, the required discharge time is five minutes.

After the indicated discharge time, the capacitor should be shorted with an insulated grounding rod or equivalent. The capacitor terminals should be connected together and to the case and grounded before handling.

FIRE PREVENTION

Although every effort is made to prevent the possibility of a case rupture, such a failure can occur. Since the dielectric fluids used in some of these capacitors are Class III8 combustible liquids, they can ignite should they be exposed to certain conditions (i.e. sufficient heat and oxygen). The dielectric fluids used in any of the impregnated capacitors have a flash point greater than 300°F (150°C). In the event the case should rupture or bushings break, the installation should be such as to guard against ignition of escaping fluids, and to limit any damage to property that could occur due to a fire. Also, the location of these capacitors should be such that they are not subjected to physical damage. Specific details regarding the fluids used in these capacitors are available on MSDS sheets by contacting the factory.

INSTALLATION

1. General

Capacitors should be located in an area where there is sufficient ventilation. Refer to instruction under heading TEMPERATURE. The assembly is gasketed and protected with a finish that is resistant to normal environmental conditions. If possible, an assembly should not be located in an area which would subject it to continuous salt air, steam, abrasive dust, or corrosive vapors.

The capacitor's nameplate rating should be checked to insure that it is the proper rating for the intended system. The maximum RMS voltage, including harmonics, should not exceed 110% of the nameplate rating. A lower voltage may be applied; however, it should be noted that the nameplate KVAR will be reduced by a factor of the square of the operating voltage divided by the nameplate voltage. For example, a 240 volt capacitor operated at 208 volts will provide 75% of the rated nameplate KVAR. $(208 / 240)^2 = 75$

2. Location

Capacitors to be connected directly at motors may be located as depicted in Figures 1, 2, and 3 on page 21. For an assembly located at a position other than directly across the motor terminals, a separate disconnect is required by the National Electrical Code.

3. Wire Size

The continuous current rating of wire used to connect the capacitors must be at least 135% of the rated capacitor line current. The formula for the capacitor line current is:

$$\text{3 Phase } I = \frac{\text{KVAR} \times 1000}{\text{Volts} \times 1.73}$$

$$\text{1 Phase } I = \frac{\text{KVAR} \times 1000}{\text{Volts}}$$

4. Connection

Type AM assemblies are connected to the line at the phase terminal block. Type ICC assemblies are connected to the line at the provided connectors. All three phase capacitor units are delta connected internally. No concern need be given to proper phase rotation or polarity. The capacitor should be grounded by connecting a ground wire to the ground lug or to the mounting bolt at the bracket.

5. Temperature

Power Factor Capacitors are designed to operate in an ambient temperature range of -40°C (-40°F) to +46°C(+115°F). The environment where the assembly is installed should be ventilated as capacitors generate heat which, if not removed, will reduce the life of the capacitors.

FUSES and PRESSURE INTERRUPTERS

The type AM and ICS single and multiple units are provided with both internal pressure interrupters and current limiting fuses. Type ICC units are protected by properly sized current limiting fuses. The fuse interrupting capacity for ICS is 200,000 amps; for AM is 100,000 amps; for ICC is 50,000 amps. The combination of external current limiting fuses and internal pressure interrupters (except ICC) provide maximum protection in preventing case rupture.

Factory installed fuses are rated from 165% to 250% of the rated capacitor line current. This safety factor allows for maximum operating conditions including momentary current surges. Should a fuse operate, the capacitor should be checked physically to see if it has bulged or swollen. If the unit appears in good condition, further tests may be made by measuring the current drawn by the capacitor when connected to a properly protected circuit. Additional testing details may be obtained from NEMA Standard Publication CP1. Should testing show that the capacitor is a good unit, the system should be checked for the possible existence of high transient or harmonic currents.

INDICATING LIGHTS

Types AM and ICS: Blown fuse indicating lights are available as an option. The lights are normally "off" but when lit indicate a fuse has operated. In the AM type units, the neon light monitors the fuse and the internal pressure activated interrupter. If either the fuse or the pressure interrupter operates, the light will illuminate indicating that a unit has been removed from the circuit. This feature is optional on type ICS. A bulged capacitor usually indicates that the pressure interrupter has operated.

Type ICC: Blown fuse lights are available as an option. The lights are normally off but when lit indicate that a fuse has operated. To operate the lights an external 120 volt AC supply must be wired to a terminal block located in the wiring compartment.

MAINTENANCE

Periodic checking of the capacitor assembly should be made to determine if any fuses are blown, any capacitors appear bulged, and all connections are tight. Under normal conditions, the capacitor should not require any maintenance during its operating life.

If a fluid leak should occur, the nearest Sales Office should be notified for disposition or replacement instructions.

In an ICC multiple unit assembly, replacement of a capacitor is made by unbolting the fuse/bus connections and the fasteners attaching the capacitors to the wiring hood, removing the wiring hood, and unbolting the capacitor cell from the mounting frame.

DISPOSAL

The disposal of defective capacitors containing dielectric fluid is governed by local and state regulations because they contain free (liquid) oil. To ensure proper disposal, contact a local hazardous waste disposal firm to determine what options are available. The preferred disposal methods are recycling or incineration. Additional information on proper disposal can be obtained by referring to the MSDS for the dielectric fluids.
